To achieve the maximum charging speed, EV3 GT must use a 400-volt electric vehicle charger that delivers at least 128kW of electricity. Actual charging speed and charging time may be influenced by the battery temperature and weather conditions. Range figures are determined according to the standardised EU measurement procedure (WLTP). Individual driving style and other factors, such as speed, outside temperature, topography and the use of electricity-consuming devices/units, have an influence on the real life range and can possibly reduce it.
